

SOLUTION BRIEFING

Maintenance & Presenting Guide

How to keep the briefing deck up to date, present it, and export a copy — the everyday essentials for the team. No coding required.

For the `solution-briefing/` web deck · No coding experience assumed

1. The basics — the files & how to make an edit

The whole deck is just three text files plus a folder of images — you don't need any special software to keep it current. You can edit all of them in any plain-text editor. **VS Code** (free) is ideal, but even Notepad/TextEdit works. Open the `solution-briefing` folder and you'll see:

File	What lives here	How often you'll touch it
<code>index.html</code>	All slide text and content — one <code><section></code> block per slide	Every content change
<code>styles.css</code>	All colors, fonts, and sizes — the brand config is at the very top	Rarely — brand is already set
<code>deck.js</code>	The navigation engine (arrow keys)	Never — leave it alone
<code>assets/</code>	The logo, images, and videos	When swapping pictures

HOW TO PREVIEW YOUR CHANGES

Double-click `index.html` to open the deck in your browser. After each edit, **save the file and press the browser's Refresh (F5)** to see it. Keep the editor and browser side by side — edit, save, refresh, repeat.

The golden rule for text edits

In `index.html`, your text sits *between* tags like `<h1>` and `</h1>`. To change wording, edit only the words between the tags — never delete the `<...>` tags themselves.

```
<!-- change the words, keep the tags -->
<h1 class="cover-title">Your headline here</h1>
    ↑ edit this part only
```

FIND WHAT YOU NEED FAST

Every slide in `index.html` starts with a big comment banner you can search for — e.g. `SLIDE 3 – SOLUTION OVERVIEW`. Use your editor's Find (Ctrl/Cmd + F) to jump straight to the slide you want to edit.

ALWAYS BACK UP FIRST

Before editing, copy the whole `solution-briefing` folder somewhere safe. If an edit ever breaks the look, you can start again from the copy. The safe rhythm is: one small edit → save → refresh → check.

2. Background video & animation

The cover slide is already wired for a background video. To use or swap it:

- 1 Put your clip in the assets folder, named `assets/cover-bg.mp4` (MP4, H.264 — export "web/1080p" from any editor). Keep it short and looping.
- 2 Optional: add a still frame `assets/cover-poster.jpg` that shows before the video loads (and in the PDF export).
- 3 That's it — it autoplays, muted, looping, behind the text.

To put a background video on **another** slide, copy these two lines from the cover slide to just inside that slide's `<section>`, and point to your file:

```
<video class="slide-bg-video" autoplay muted loop playsinline poster="assets/my-poster.jpg">
  <source src="assets/my-clip.mp4" type="video/mp4" />
</video>
<div class="slide-bg-scrim"></div>  <!-- darkens the video so text stays readable -->
```

OFFLINE & AUTOPLAY NOTES

Videos **must be muted** to autoplay. Bundle the actual video file in `assets/` (never link a YouTube/CDN URL) so the deck works with no internet. If a video won't play from a double-clicked file, serve the folder locally — see the deck's [README](#).

The moving grid "sensor sweep" behind every slide is pure animation (no file) and already on — nothing to maintain.

3. Exporting a static copy (PDF & PowerPoint)

PDF — easy and faithful (recommended)

- 1 Open the deck in **Google Chrome** or Edge.
- 2 Press **Ctrl/Cmd + P**.
- 3 Destination → **Save as PDF**. Set **Margins: None** and tick **Background graphics**.
- 4 Save. You get one clean slide per page — perfect as a leave-behind or email attachment.

The deck already has a print stylesheet that lays out exactly one slide per page and reveals all animated elements. Video backgrounds can't appear in a PDF, so the poster image / dark background shows instead — that's why a `cover-poster.jpg` is worth adding.

PowerPoint (.pptx) — the honest caveat

READ THIS BEFORE PROMISING A .PPTX

A rich, animated web deck **cannot** be converted into an equally-rich, editable PowerPoint. Videos, animations, and custom layouts do not round-trip into editable PowerPoint shapes. There is no lossless "Save as PPTX."

Two realistic options:

- **Best for handouts:** use the **PDF** above. It opens everywhere, looks identical, and needs no PowerPoint.
- **If a .pptx is truly required** (e.g. to paste slides into a corporate template): export the PDF, then in PowerPoint *insert each PDF page in as a picture*, or open the PDF in a converter. You'll get one *image* per slide — not editable text, but it drops into any template. This is a fallback, not a primary workflow.

The recommendation: **present from the live web deck** (that's where the videos and animation shine), and **hand out the PDF**.

4. Presenting & putting it in front of customers

Presenting — keyboard shortcuts

Key	Action	Key	Action
→ / Space	Next slide	F	Fullscreen
←	Previous slide	Home / End	First / last slide

You can also click the right or left half of the screen to move forward or back, or use the on-screen arrows in the bottom-right. Press **F** (or the  button) for fullscreen before you present.

On a company website (for easy access)

Upload the whole `solution-briefing/` folder to any static web host — your company web server, an S3 bucket, SharePoint, Netlify, or GitHub Pages. There's no server-side code, so "hosting" is just copying files. Share the link; it opens in any browser.

On a laptop with no internet (trade-show floor)

Copy the same `solution-briefing/` folder onto the laptop (or a USB stick). Double-click `index.html`. Because every font, image, and video is bundled in the folder, it runs fully offline — identical to the hosted version.

ONE DECK, BOTH MODES

The hosted copy and the offline copy are the *same files*. Keep one master folder, and whenever it's updated, re-upload it to the website and re-copy it to the presenting laptops.

★ One-Page Cheat Sheet — common edits

Everything you need for day-to-day tweaks. `index.html` = words & pictures. `styles.css` = colors, fonts, sizes.

Change wording on a slide

In `index.html`, edit the text *between* the tags. Keep the tags.

```
<h3>Your new title</h3>
```

Change a color (whole deck)

In `styles.css`, top `:root` block. Change the 6-char hex.

```
--brand-accent: #e2231a;  
--brand-primary: #101820;
```

Font color of one piece of text

Wrap it and add an inline color (in `index.html`):

```
<span style="color:#e2231a">text</span>
```

Or use the built-in accent: `<span class="accent">text</span>`

Background color of a slide

Whole deck: change `--brand-primary`. One slide only — add to that `<section>`:

```
<section class="slide" style="background:#101820">
```

Bigger / smaller font

One item — add an inline size (in `index.html`):

```
<h2 style="font-size:3rem">...</h2>
```

A whole class of text: change its size variable in `styles.css`, e.g. `--size-section-title`.

Bold / italic / underline

```
<strong>bold</strong>  
<em>italic</em>  
<u>underlined</u>
```

Wrap the words you want to style. They can nest: `<strong><em>both</em></strong>`.

Change a picture / logo

Drop the new file in `assets/`, then point to it in `index.html`:

```

```

Or just overwrite `assets/logo.svg` with a file of the same name.

Change the font

In `styles.css` `:root` block:

```
--font-heading: "Arial Black", sans-serif;  
--font-body: "Georgia", serif;
```

Add / delete / move a slide

Copy, delete, or move a whole block from `<section>` to `</section>`.

Change a bar-chart bar

Height = the `--h` percentage (on the proof slide, `index.html`):

```
<section class="slide">
  ... slide content ...
</section>
```

```
<div class="bar" style="--h: 72%">
```

Highlight a word in accent color

```
<span class="accent">wins</span>
```

Uses your `--brand-accent` color automatically.

Export to PDF

Open in Chrome → **Ctrl/Cmd+P** → **Save as PDF** →
Margins **None**, tick **Background graphics**.

Presenting — keyboard shortcuts

Key	Action	Key	Action
→ / Space	Next slide	F	Fullscreen
←	Previous slide	Home / End	First / last slide

SAFETY NET

Before editing, copy the whole `solution-briefing` folder somewhere safe. If an edit breaks the look, you can always start again from the copy. Small edits, save, refresh — that rhythm keeps you out of trouble.
